Proper Battery Use and Care

Sam Reeder (WW4ZT)

Best Practices for AGM Battery Maintenance

Sam Reeder, WW4ZT

AGM & Battery Basics

- AGM batteries are low-maintenance due to their design, requiring no watering, and can be used in various positions. They perform well in cold conditions and resist vibrations.
- Starter batteries provide short bursts of power for engine starts, backup power when alternators fall short, and absorb potential overcharge. They are not meant for continuous discharge.
- Deep-cycle batteries supply long-term power for electric vehicles, electronics, or homes.
- Hybrid AGM Starting duty batteries are mainly used in marine and sport utility applications.
- Avoid mixing battery sizes, capacities, or ages to prevent accelerated wear and reduced reliability. Charge AGM batteries regularly to prevent sulfation and extend their life.

AGM Battery Best Practices

- Protect batteries from heat and cold.
 - Store batteries for renewable energy systems in insulated, ventilated boxes ideally where temps are mild.
- Use only AGM battery compatible chargers.
 - AGM batteries have less internal resistance and recharge faster than regular lead-acid models which could lead to excessive voltage and overheating.
 - Overheating can cause the battery safety valve to pop which most of which will not reset.

AGM Battery Best Practices (cont.)

- Don't discharge batteries too deeply!
 - A lead acid battery's percent charge is directly related to its voltage, where a higher voltage indicates a higher percentage of charge; for example, a fully charged 12-volt lead acid battery typically reads around 12.6 volts (100% charge), while a significantly lower voltage like 12.2 volts would represent a lower charge percentage (around 50%).
 - Lead acid battery voltage and charge percentage equivalents:
 - 100% charge: Around 12.6 - 12.7 volts
 - 75% charge: Around 12.4 volts
 - 50% charge: Around 12.2 volts
 - 25% charge: Around 12.0 volts

Key Factors to Consider

- Different types of lead acid batteries (flooded, AGM, gel) may have slightly different voltage readings at the same charge level.
- Voltage readings are to be made while the battery is not under charge.
- Voltage reading to determine state of charge as follows: 1) disconnect battery from charger and load. 2) after 5 minutes make and record reading. 3) repeat the reading cycle until battery voltage readings repeat.
 - This is not a load test. Only a load test can tell you how long your battery will last, and that is only a scientific wild-ass guess (SWAG)
- The voltage can fluctuate wildly depending on the current draw from the battery.
